

rrdtool.exe报错，是指此软件在服务器无法正常运行，这个是记录流量数据的，不影响业务的正常使用。可以将配置受控端主目录下的配置文件参数**enable_monitor**设置为**false**，然后重启受控端。

The screenshot shows a Windows File Explorer window with the address bar set to 'D:\ZHyperV'. The file list includes folders like Files, Init, logs, nyterminal, rrd, skin, temp, tmpiso, wsgate and files like 7z.dll, 7z, auditmo.dll, cares.dll, and config. The 'config' file is selected, and a Notepad window titled 'config - 记事本' is open below it, displaying the following configuration:

```
[base]
port=3301
switch_name=wai
in_switch_name=nei
notify_url=
secret_key=
enable_monitor=false
sn=
```
